### Luxating instruments

Dental instrument to sever tooth-fixed ligaments. The extremely flat and sharp edged form of the working ends allows a very gentle penetration into the periodontal gap. Here, the Luxating Instruments are only used in a rotating and cutting manner and allows a very gentle widening of the alveole. The Luxating Instruments are available in the 8 different versions shown.

### Root elevators-SET

**547-SET**  
Contents: 547/1 - 2,8mm,  
547/2 - 3,5mm,  
547/3 - 4,0mm

**SPECIAL**

- The elliptically ground area on the instrument tip (2) and the diamond-shaped plateau (1) permit it to penetrate the interdental space and periodontal cleft optimally.
- Designed for 180° rotation for 4 luxation movements: 2x mesial and 2x distal. During luxation, the elevator exerts 5 - 7 hypomochlians (rotation and supporting actions), which is vastly superior to any conventional elevator (max. 1 - 2 hypomochlians). The grooves (3) on the edge of the instrument provide for especially efficient luxation.
- The instrument tips are not designed for axial leverage as this may cause them to fracture.
